## Important notice

Dear Customer,
On 7 February 2017 the former NXP Standard Product business became a new company with the tradename Nexperia. Nexperia is an industry leading supplier of Discrete, Logic and PowerMOS semiconductors with its focus on the automotive, industrial, computing, consumer and wearable application markets

In data sheets and application notes which still contain NXP or Philips Semiconductors references, use the references to Nexperia, as shown below.

Instead of http://www.nxp.com, http://www.philips.com/ or http://www.semiconductors.philips.com/, use http://www.nexperia.com

Instead of sales.addresses@www.nxp.com or sales.addresses@www.semiconductors.philips.com, use salesaddresses@nexperia.com (email)

## 74ALVCH16841 20-bit bus interface D-type latch (3-State)

## FEATURES

- Wide supply voltage range of 1.2 V to 3.6 V
- Complies with JEDEC standard no. 8-1A
- Wide supply voltage range of 1.2 V to 3.6 V
- CMOS low power consumption
- Direct interface with TTL levels
- MULTIBYTE ${ }^{\text {TM }}$ flow-through standard pin-out architecture
- Low inductance multiple $\mathrm{V}_{\mathrm{CC}}$ and GND pins for minimum noise and ground bounce
- Current drive $\pm 24 \mathrm{~mA}$ at 3.0 V
- All inputs have bus hold circuitry
- Output drive capability $50 \Omega$ transmission lines @ $85^{\circ} \mathrm{C}$
- 3-State non-inverting outputs for bus oriented applications

## DESCRIPTION

The 74ALVCH16841 has two 10-bit D-type latch featuring separate D-type inputs for each latch and 3-State outputs for bus oriented applications. The two sections of each register are controlled independently by the latch enable (nLE) and output enable ( $\mathrm{n} \overline{\mathrm{OE} \text { ) }}$ control gates.

When nOE is LOW, the data in the registers appears at the outputs. When $n \overline{O E}$ is High the outputs are in High-impedance OFF state. Operation of the nOE input does not affect the state of the flip-flops.
The 74ALVCH16841 has active bus hold circuitry which is provided to hold unused or floating data inputs at a valid logic level. This feature eliminates the need for external pull-up or pull-down resistors.

## NOTES:

1. $\mathrm{C}_{\mathrm{PD}}$ is used to determine the dynamic power dissipation ( $\mathrm{P}_{\mathrm{D}}$ in $\mu \mathrm{W}$ ):
$P_{D}=C_{P D} \times V_{C C}{ }^{2} \times f_{i}+\Sigma\left(C_{L} \times V_{C C}{ }^{2} \times f_{0}\right)$ where: $f_{i}=$ input frequency in $M H z ; C_{L}=$ output load capacitance in pF ;
$\mathrm{f}_{\mathrm{O}}=$ output frequency in $\mathrm{MHz} ; \mathrm{V}_{\mathrm{CC}}=$ supply voltage in $\mathrm{V} ; \Sigma\left(\mathrm{C}_{\mathrm{L}} \times \mathrm{V}_{\mathrm{CC}}{ }^{2} \times \mathrm{f}_{\mathrm{o}}\right)=$ sum of outputs.

## Definitions

Short-form specification - The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.
Limiting values definition - Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.
Application information - Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.
